to speak

Use the raise hand icon to bring
attention to your question

any time during webinar:
type your question here
and then press Send

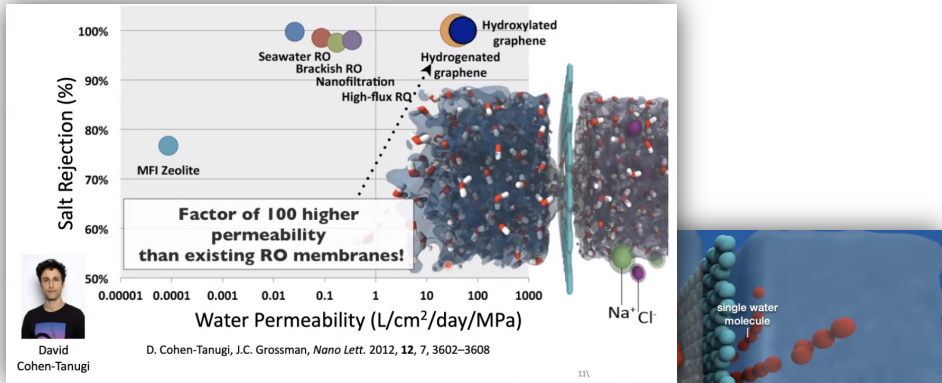

Outline

- Motivation
- Permeation & Permeability
- Simulation Approaches
 - At thermodynamic equilibrium
 - Non-equilibrium simulation technique
- Example in detail: **Boundary-Driven Non-Equilibrium Molecular Dynamics** simulation of nanofiltration of a N_2/CO_2 gas mixture
- Summary

Motivation

- Purification of fluids by mechanical separation
 - Simulation of desalination of water, as discussed in Jeff Grossman's plenary talk
- Separation of gas mixtures with high pressure filtration through polymer membranes

Computationally Predicted:

- * Ultra-High permeability
- * Tunable Selectivity
- * Mechanical Resilience

→ what about experiments?

Permeation and Permeability

Permeation is usually described experimentally by a **permeability coefficient**, P , defined by¹:

$$P = \frac{(\text{quantity of permeant}) \times (\text{membrane thickness})}{(\text{area}) \times (\text{time}) \times (\text{pressure drop across membrane})}$$

which is equivalent to the following:

$$P = D \times S$$

where D denotes the diffusivity, and S the solubility.

In atomistic simulations of gas penetrant systems, D can often be obtained directly using molecular dynamics simulation, while S can be obtained by Monte Carlo methods.

1. see, for example, Polymer Handbook, J. Brandrup & E.H. Immergut (eds)

Tutorial: Simulation of Permeability of O₂ in Polystyrene

Permeability of O₂ in Polystyrene

Release 3.4.1

- **Objective:** Learn how to set up:
 - GIBBS Monte Carlo simulations in MedeA to calculate solubility
 - LAMMPS molecular dynamics simulations in MedeA to calculate diffusivity
 - Combine diffusivity and solubility to estimate the permeability of a light compound (oxygen) in a polymer (polystyrene)
- **Modules:** Amorphous Materials Builder, LAMMPS, Diffusion, GIBBS

		
Preparation time	Run time (8 cores)	Level
30 minutes	6 hours	Beginner

Note: This tutorial can be accelerated using the following prepared flowcharts:

- O2_in_PS_Equilibration_LAMMPS.flow
- O2_in_PS_Solubility_GIBBS.flow
- O2_in_PS_Diffusivity_LAMMPS.flow

Outline

- Permeability of O₂ in Polystyrene
 - Introduction
 - Build Amorphous PS and O₂
 - Create an atactic polystyrene chain
 - Sketch an O₂ molecule
 - Select and assign forcefield
 - Build an amorphous model of PS and O₂ and create subsets
 - Equilibrate the model
 - Calculate the Solubility of O₂ in PS
 - Analyze simulation results from Job_*.out
 - Analyze the solubility of O₂ in PS
 - View absorption isotherm
 - Calculate the Diffusivity of O₂ in PS

1

- Calculations of properties at thermodynamic equilibrium
 - **Diffusivity** based Brownian motion (mean-square displacements) using molecular dynamics (MD) simulations with *MedeA LAMMPS Diffusion*
 - **Solubility** based on adsorption using grand-canonical Monte Carlo simulations with *MedeA GIBBS*
 - Interatomic interactions are described with *PCFF+*: **p**olymer **c**onsistent **f**orce**f**ield, continuously extended & developed by Materials Design
- Tutorial available at <http://my.materialsdesign.com/tutorials>

Example: Diffusivity of O₂ in Polystyrene

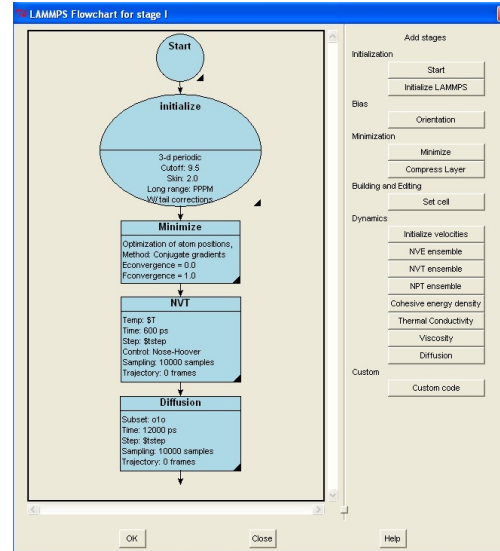

MD Simulations at thermodynamic equilibrium

Model system containing 2 atactic PS molecules with DP=80, with 8 added oxygen molecules (2580 atoms total), with *LAMMPS Diffusion* Flowchart

Amorphous Materials Builder

MedeA flowchart

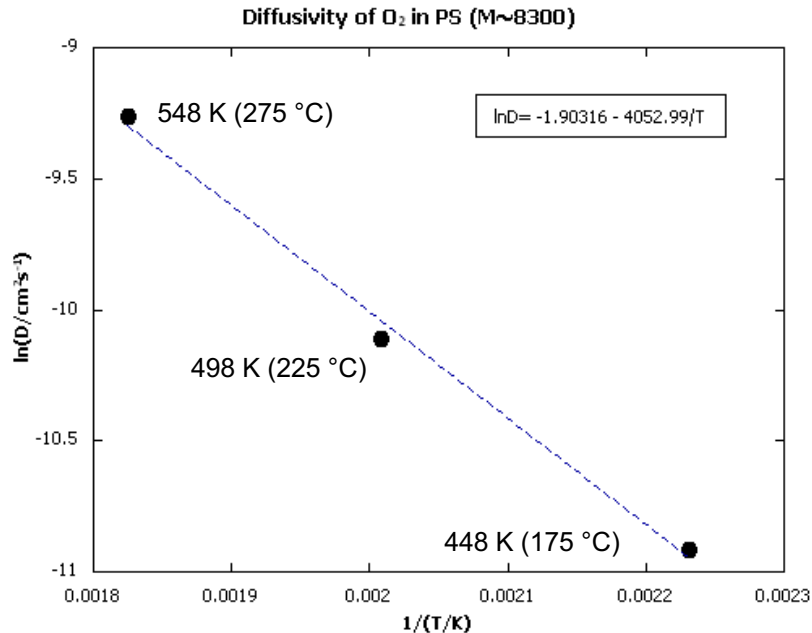

Diffusivity of O₂ in Polystyrene at Thermodynamic Equilibrium

Arrhenius plot for O₂ in atactic PS (448-548K)

- Predicts D ~ 1.87 x 10⁻⁷ cm²s⁻¹ at 298K (25 °C)

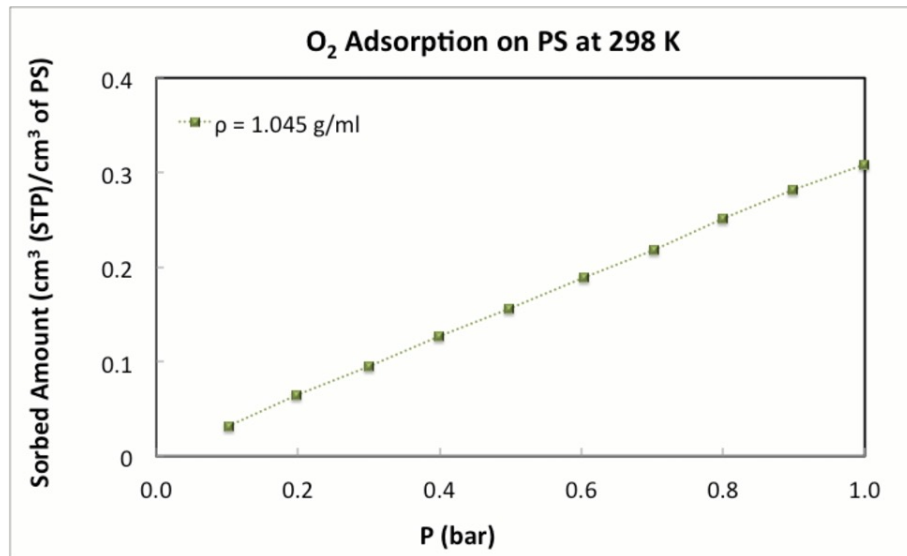

Compute engine: *MedeA LAMMPS*
Property module: *MedeA Diffusion*
Interatomic potential: *MedeA PCFF+*

Solubility of O₂ in Polystyrene

Pressure dependence of solubility of O₂ in atactic PS at 298K

- Note: 0.3 cm³(STP)/cm³ of PS corresponds to ~0.21 molecules per simulation cell
- Experimental density: Zoller & Walsh (1995), p133

Compute engine: *MedeA GIBBS*
Interatomic potential: *MedeA PCFF+*

Permeation and Permeability: Calc. vs Exp.

Comparison of calculated and experimental permeability data for O₂ in atactic PS at 298K

	D (x10 ⁷) cm ² /s	S (x10 ⁶) cm ³ (STP)/(cm ³ .Pa)	P (x10 ¹³) cm ³ (STP).cm/(cm ² .s.Pa)
Calculated	1.87 ^{a)}	3.1-3.2	5.8-6.0
Burmeister et al	-	-	1.35-1.85

Tutorial: Simulation of Gas Transport Through Membranes

materials design TUTORIAL

Simulation of Transport of Fluids in Kerogen Nanopores

- **Objective:** Learn how to calculate transport properties of fluids in kerogen nanopores by applying boundary-driven non-equilibrium molecular dynamics (BD-NEMD) simulations with Medea.
- **Modules:** Medea Amorphous Materials Builder, Medea LAMMPS

Preparation time	Run time (16 cores)	Level
60 minutes	22 hours	Intermediate

Note: Required files:

- Structures: kerogen-IP-C-layer.scf
- Flowchart: BD-NEMD-CPU.flow

These files are part of a separate zip file *Tutorial-Simulation-fluid-transport-kerogen.zip* which is available in the Materials Design tutorial repository.

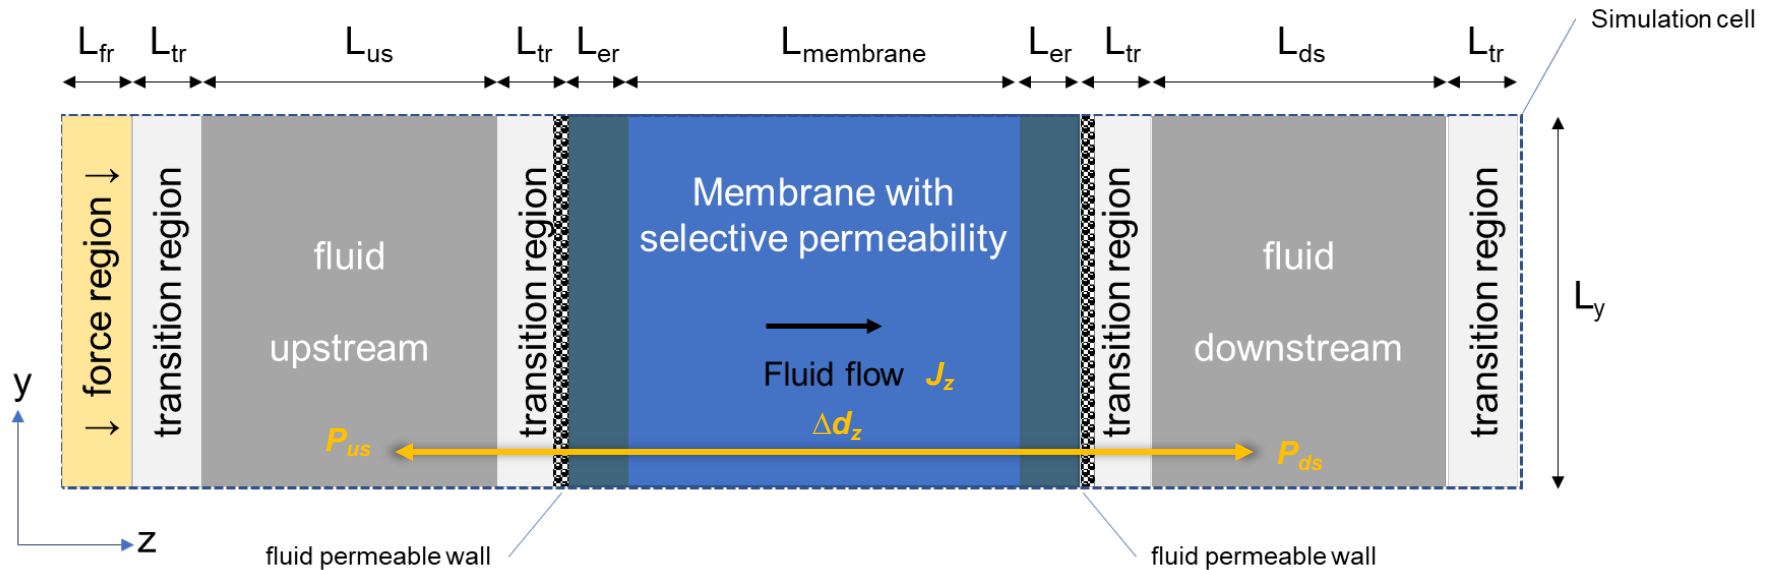

Outline

- Simulating Fluid Transport in Kerogen Nanopores
 - Introduction
 - Computational Procedure
 - Overview of the BD-NEMD Approach
 - BD-NEMD Implementation in a Medea Flowchart
 - Simulation of Methane Transport in a Kerogen Slit-Pore
 - Kerogen Layer for a Slit-Pore
 - Create the Spec-File of an Ensemble of Methane Molecules
 - Setup and Submission of the BD-NEMD Simulation
 - Analysis of Results
 - Visualize Structures
 - Animate Trajectories of the MD Simulations
 - Visualize Charts of Calculated Properties
 - Property Evolution Charts
 - Charts with Density Profiles
 - Charts with Temperature Profiles
 - Charts with Velocity Profiles
 - Charts with Flux Profiles

- Calculation of Fickian diffusion which occurs in systems not in thermodynamic equilibrium due to, e.g. pressure gradients
- gas flux along one direction i : $J_i = K_P \Delta P / \Delta d_i$
 - ΔP : pressure difference between two regions separated by a distance Δd_i ($i = x, y, z$)
 - K_P : permeability of the membrane
- Simulation approach: **boundary-driven non-equilibrium molecular dynamics (BD-NEMD)** simulations introduced by Frentrup et al. (In Silico Determination of Gas Permeabilities by Non-Equilibrium Molecular Dynamics: CO₂ and He through PIM-1, Membranes 5, 99 (2015)).
- Tutorial available at <http://my.materialsdesign.com/tutorials>

BD-NEMD Simulation Setup

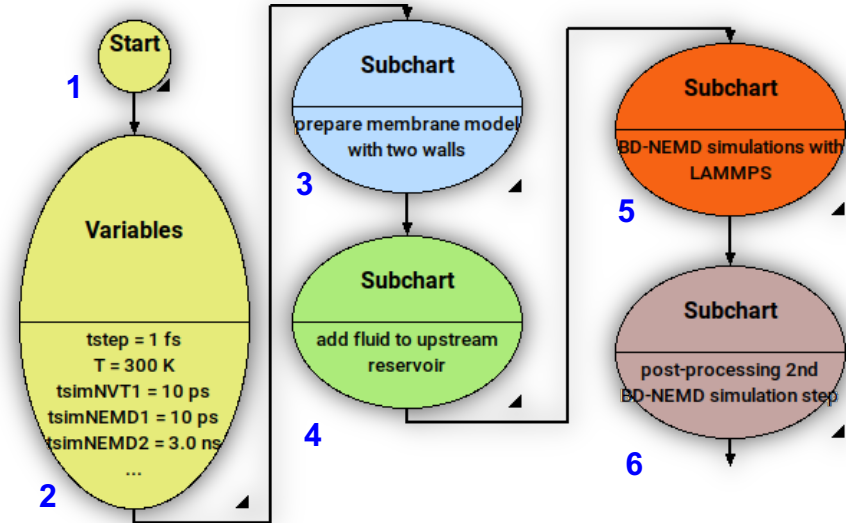

- Flow/flux: $J_z = v_z \rho = K_P \Delta P / \Delta d_z$
 - v_z : average velocity of fluid in the membrane along the z -direction
 - ρ : average density of fluid in the membrane
- All lengths L_i are explained in the tutorial

BD-NEMD Implementation in a *MedeA* Flowchart

Flowchart consists of six stages

1. Brief explanation about how to use the flowchart
2. defines running parameters
3. prepares the simulation cell with the membrane, two fluid-permeable walls, and the two empty fluid reservoirs
4. adds the fluid to the upstream reservoir of the simulation cell
5. performs BD-NEMD simulation with *MedeA LAMMPS*
6. post-processes the results of the BD-NEMD simulation

Selected Membrane for BD-NEMD Simulation: PTMSP

- Poly(1-trimethylsilyl-1-propyne)
- typical high free volume, highly permeable glassy polymer
- Density (25°C): 0.75 g/cm³
- Glass transition temp. > 200 °C

Fractional free volume (FFV): 33%, depends on ratio cis- / trans- isomers and the sequence in main chain

- Used to separate mixtures of
 - CO₂/N₂
 - CH₄/CO₂
 - n-C₄H₁₀/CH₄
- Predominant separation mechanism: competing solubility of gas constituents in PTMSP

1. Hofmann et al., Free Volume Distributions in Ultrahigh and Lower Free Volume Polymers: Comparison between Molecular Modeling and Positron Lifetime Studies, *Macromolecules* 35, 2129 (2002).
2. Ricci et al., Modelling Sorption and Transport of Gases in Polymeric Membranes across Different Scales: A Review, *Membranes* 12, 9 (2022).

Steps to Perform BD-NEMD Simulation

1. Build polymer chain with trans- and cis-isomers of the TMSP polymer repeat units
2. Create initial structure of PTMSP membrane model
3. Condition PTMSP membrane model
4. Calculate density of 1:1 mixture of CO₂ and N₂ at 50 bar (5 MPa)
5. Create fluid mixture for BD-NEMD simulation based on the results of the previous step
6. Setup the BD-NEMD simulation
7. Analyse the results of the BD-NEMD simulation

Summary

- BD-NEMD simulations are useful to calculate transport of gases through nano-porous membrane models
- Simulated transport is based on Fickian diffusion due to imposed pressure difference
- Key results of example calculation: separation of CO₂/N₂ gas mixture with PTMSP membrane depends on applied pressure difference
 - Best separation is achieved for pressure differences of 30-40 bar
- Nex steps: Test BD-NEMD approach for other transport phenomena of gases and liquids
 - Desalination of salt water
 - Transport of charge carriers in liquid electrolytes
 - ...

MedeA Modules Used in the Training

- *MedeA Environment*, incl. *MedeA LAMMPS*, *Polymer Builder*
- *Amorphous Materials Builder (AMB)*
- *MedeA HT Launchpad* for structure handling in flowcharts

TUTORIAL

Absorption of Carbon Dioxide in Kerogen

- **Objective:** Learn how to calculate an absorption isotherm of small molecules in materials with MedA.
- **Modules:** GIBBS

		
Preparation time	Run time (4 Intel cores)	Level
30 minutes	1 hour	Beginner

Note: This tutorial can be accelerated using the following files:

- *minimize-CO2-with-LAMMPS.flow*
- *Absorption-Isotherm-of-CO2-in-Kerogen.flow*
- *KIA-Burnts.scd*

Outline

- *Absorption of Carbon Dioxide in Kerogen*
 - Introduction
 - Select the Forcefield
 - Retrieve and Prepare a CO₂ Molecule
 - Prepare the Kerogen Host
 - Calculate the Absorption of CO₂ in Kerogen
 - Analyze the Results
 - Results in Job.out
 - Open Atomic Structure of CO₂ Molecules in the Kerogen Host
 - Conclusion

1 Introduction

In this tutorial, you will use MedA GIBBS to calculate the isotherm of the absorption of carbon dioxide (CO₂) in a model structure of a so-called Green River Shale kerogen, for a temperature of 273 K and a CO₂ pressure of 1.06 bar, i.e. 106 kPa. According to the nomenclature of Ungerer et al.¹ the kerogen model is one of the 1-A samples and is immature with respect to hydrocarbon generation.

¹ Ungerer, J. Collet, M. Yiamourakou, Molecular modeling of the volumetric and thermodynamic properties of kerogen: influence of organic type and maturity. *Energy & Fuels* **28**, 91 (2014).
